

FLOORING

PAVIMWC

Taking into account the need for ensuring hygiene also on the floor area underlying toilets, a special system has been devised in order to replace traditional flooring. PAVIM WC consists of a stainless steel frame supporting a floor-recessed tank in plastic reinforced by fibre glass covered by a heel-proof stainless steel grating (thickness: 2.5 cm). It is combined with flushometers equipped with a special electronic control operating the water sprayers placed in the tank below the grating after each flushing of the toilet bowl. The supporting frame to be walled is in 1.5 mm-thick stainless steel. The underlying tank is in black plastic reinforced by fibre glass (thickness: 5mm) and is fitted with 6 water sprayers. The tank can be inspected for maintenance and cleaning by simply removing the grating. Complete with flexible pipe for water connection.
